

ENGINE

Teaching online electronics, microcontrollers and programming in Higher Education

Output 2: Online Course for Microcontrollers: syllabus, open educational resources

Open project leaflet: Module_1-3 communication and ADC

Lead Partner: International Hellenic University (IHU)

Authors: Theodosios Sapounidis [IHU], Aristotelis Kazakopoulos [IHU], Aggelos Giakoumis [IHU], Sokratis Tselegkaridis [IHU]

Declaration

This report has been prepared in the context of the ENGINE project. Where other published and unpublished source materials have been used, these have been acknowledged.

Table of Contents

Executive summary	4
Chapter 1: Open project 1	5
Chapter 2: Open project 2	6
Chapter 3: Open project 3	7

Executive summary

This file contains open projects.

Chapter 1: **Open project 1**

Draw a circuit and write the appropriate code so that the Arduino Uno works as a Serial Echo. That is, to send back the data it reads to the serial port.

Chapter 2: Open project 2

Draw a circuit and write the appropriate code so that the Arduino Uno works as a dimmer. More specifically, a potentiometer connected to PIN_A0 will adjust the brightness of an LED connected to PIN_10.

Tip. The resolution of ADC is 10 bits (0 ~ 1024), while the resolution of PWM is 8 bits (0 ~ 512)

Chapter 3: Open project 3

Draw a circuit and write the appropriate code so that the Arduino Uno works as an up / down-counter that counts from 0 to 9 (or from 9 to 0) and shows the numbers in a common cathode 7 segment display. All settings will be made via serial communication. The commands that the Arduino Uno will accept are:

- “s” => start
- “p” => pause
- “r” => reset
- “c” => continue
- “U” => up-counter
- “D” => down-counter

Starting the system, by default will be a down-counter, and will change number every second.

***Tip1.** Pay attention to the connections of the 7 segment display*

***Tip2.** Pay attention to the commands of serial communication between lowercase and uppercase letters*
